Layout

• • •

3

Sizing and Positioning

How does the programmer specify where each component appears, how big each component should be, etc.?

- Absolute positioning (C++, C#, others):
 - Programmer specifies exact pixel coordinates of every component.
 - Put this button at (x=15, y=75) and make it 70x31 px in size."
- Layout managers (Java, Android):
 - Objects that decide where to position each component based on some general rules or criteria.
 - "Put these four buttons into a 2x2 grid and put these text boxes in a horizontal flow in the south part of the app."
 - More flexible and general; works better with a variety of devices.

ViewGroup as layout

- ViewGroup superclass represents containers of widgets/views
 - layouts are described in XML and mirrored in Java code
 - Android provides several pre-existing layout managers;
 you can define your own custom layouts if needed
 - layouts can be nested to achieve combinations of features
- in the Java code and XML:
 - an Activity is a ViewGroup
 - various Layout classes are also ViewGroups
 - widgets can be added to a ViewGroup, which will then manage that widget's position/size behavior

XML

- XML: a language for describing hierarchical text data. *
 - Uses tags that consist of elements and attributes. Tags can be nested.
 - Some tags are opened and closed; others self-close.

```
<element attr="value" attr="value"> ... </element>
<element attr="value" attr="value" /> (self-closing)
```

* XML is case-sensitive!

Example:

</course>

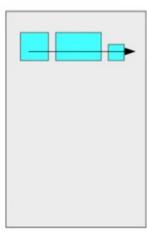

Changing layouts

- go to the **Text** view for your layout XML file
- modify the opening/closing tags to the new layout type,
 e.g. LinearLayout
- now go back to **Design** view and add widgets

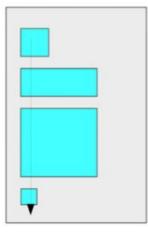

LinearLayout

- · lays out widgets/views in a single line
- orientation of horizontal (default) or vertical
- items do not wrap if they reach edge of screen!

horizontal

vertical

LinearLayout example1

```
<LinearLayout ...
        android:orientation="horizontal"
                                                         BUTTON 1 | BUTTON 2 HOORAY | BUTTON 3
        tools:context=".MainActivity">
    <Button ... android:text="Button 1" />
    <Button ... android:text="Button 2 Hooray" />
    <Button ... android:text="Button 3" />
    <Button ... android:text="Button 4
                          Very Long Text" />
</LinearLayout>
```

 In our examples, we'll use ... when omitting boilerplate code that is auto-generated by Android Studio and not relevant to the specific example at hand.

LinearLayout example 2

```
<LinearLayout ...
        android:orientation="vertical"
        tools:context=".MainActivity">
    <Button ... android:text="Button 1" />
    <Button ... android:text="Button 2
                                Hooray" />
    <Button ... android:text="Button 3" />
    <Button ... android:text="Button 4
                        Very Long Text" />
</LinearLayout>
```

Gravity

gravity: alignment direction that widgets are pulled

50

BUTTON 4 VERY LONG TEXT

- top, bottom, left, right, center
- combine multiple with
- set gravity on the layout to adjust all widgets;
 set layout_gravity on an individual widget

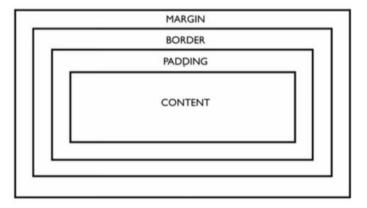

Weight

- weight: gives elements relative sizes by integers
 - widget with weight K gets K/total fraction of total size
 - cooking analogy: "2 parts flour, 1 part water, ..."

Widget Box Model (<-> WEB)

- content: every widget or view has a certain size (width x height) for its content, the widget itself
- padding: you can artificially increase the widget's size by applying padding in the widget just outside its content
- border: outside the padding, a line around edge of widget
- margin: separation from neighboring widgets on screen

Sizing an individual widget

- width and height of a widget can be:
 - wrap_content : exactly large enough to fit the widget's content
 - match_parent : as wide or tall as 100% of the screen or layout
 - a specific fixed width such as 64dp (not usually recommended)
 - dp = device pixels; dip = device-independent pixels; sp = scaling pixels

```
<Button ...
android:layout_width="match_parent"
android:layout_height="wrap_content" />
```

Padding

- padding: extra space inside widget
 - set padding to adjust all sides;
 paddingTop, Bottom, Left, Right for one side
 - usually set to specific values like 10dp
 (some widgets have a default value ~16dp)

```
BUTTON 1 
BUTTON 2 HOORAY

BUTTON 3
```

Margin

• margin: extra space outside widget to separate it from others

BUTTON 1 →

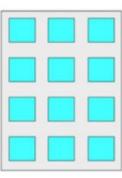

BUTTON 3

BUTTON 2 HOORAY

- set layout_margin to adjust all sides;
 layout_marginTop, Bottom, Left, Right
- usually set to specific values like 10dp (set defaults in res/values/dimens.xml)

GridLayout

- lays out widgets/views in lines of rows and columns
 - orientation attribute defines row-major or column-major order
 - introduced in Android 4; replaces older TableLayout
- by default, rows and columns are equal in size
 - each widget is placed into "next" available row/column index unless it is given an explicit layout row and layout column attribute
 - grid of 4 rows, 3 columns:

GridLayout example 1

```
<GridLayout ...
        android:rowCount="2"
        android:columnCount="3"
        tools:context=".MainActivity">
    <Button ... android:text="Button 1" />
    <Button ... android:text="Button Two" />
    <Button ... android:text="Button 3" />
    <Button ... android:text="Button Four" />
    <Button ... android:text="Button 5" />
    <Button ... android:text="Button Six" />
</GridLayout>
```

GridLayout example 2

```
<GridLayout ...
                                                             530
        android:rowCount="2"
        android:columnCount="3"
        android:orientation="vertical">
    <Button ... android:text="Button 1" />
    <Button ... android:text="Button Two" />
    <Button ... android:text="Button 3" />
    <Button ... android:text="Button Four" />
    <Button ... android:text="Button 5"
                android:layout row="1"
                android:layout_column="2" />
    <Button ... android:text="Button Six"
                android:layout_row="0"
                android:layout column="2" />
</RelativeLayout>
```

GridLayout example 3

```
<GridLayout ...
        android:rowCount="2"
        android:columnCount="3">
    <Button ... android:text="B1" />
                                                                 BUTTON #8
    <Button ... android:text="B2" />
    <Button ... android:text="Button Number 3!" />
    <Button ... android:text="B4"
       android:layout_columnSpan="2"
       android:layout gravity="center" />
    <Button ... android:text="B5" />
    <Button ... android:text="B6"
       android:layout_paddingTop="40dp"
       android:layout_paddingBottom="40dp" />
    <Button ... android:text="B7" />
    <Button ... android:text="Button #8"
       android:layout_gravity="right" />
</RelativeLayout>
```

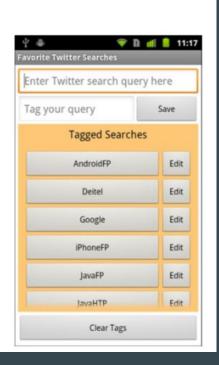

Nested Layout

- to produce more complicated appearance, use a **nested** layout
 - (layouts inside layouts)
- what layout(s) are used to create the appearance at right?
 - overall activity:
 - internal layouts:

Nested layout template

```
<OuterLayoutType ...>
    <InnerLayoutType ...>
        <Widget ... />
        <Widget ... />
    </InnerLayoutType>
    <InnerLayoutType ...>
        <Widget ... />
        <Widget ... />
    </InnerLayoutType>
   <Widget ... />
    <Widget ... />
</OuterLayoutType>
```

Nested layout exercise

- Write the layout XML necessary to create the following app UI.
 - How many overall layouts are needed?
 - Which widgets go into which layouts?

- ...

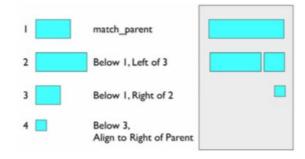

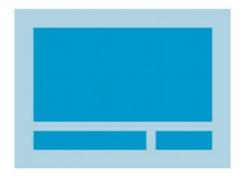

Nested layout solution

```
<LinearLayout ...
       android:orientation="vertical" android:gravity="center|top">
   <Button ... android:text="B1" />
   <LinearLayout ...
            android:layout_width="match_parent"
            android:layout_height="wrap_content"
                                                                                         5:00
            android:orientation="horizontal"
            android:gravity="center|top">
       <Button ... android:text="B2" />
       <Button ... android:text="Button Number 3" />
       <Button ... android:text="B4" />
                                                                               87 BUTTON NUMBER 8
   </LinearLayout>
   <Button ... android:text="B5" />
    <Button ... android:text="B6" android:layout_gravity="left" />
   <LinearLayout ...
            android:layout_width="match_parent"
            android:layout_height="wrap_content"
            android:orientation="horizontal"
            android:gravity="center|top">
       <Button ... android:text="B7" />
       <Button ... android:text="Button Number 8" />
   </LinearLayout>
</LinearLayout>
```

RelativeLayout

- each widget's position and size are relative to other views
 - relative to "parent" (the activity itself)
 - relative to other widgets/views
 - x-positions of reference: left, right, center
 - y-positions of reference: top, bottom, center
- intended to reduce the need for nested layouts

Relative anchor points

- properties for x/y relative to another widget:
 - layout_below, above, toLeftOf, toRightOf
 - set these to the ID of another widget in the format "@id/theID" (obviously, the given widget must have an ID for this to work)
- properties for x/y relative to layout container (the activity):
 - layout_alignParentTop, Bottom, Left, Right
 - set these flags to a boolean value of "true" to enable them
 - layout_centerHorizontal, Vertical, InParent
 - set these flags to "true" to center the control within its parent in a dimension

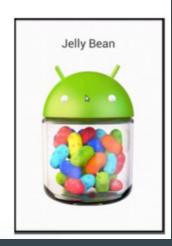

RelativeLayout example 1

```
<RelativeLayout ... >
    <Button ... android:id="@+id/b1" android:text="B1"
        android:layout alignParentTop="true"
        android:layout centerHorizontal="true" />
    <Button ... android:id="@+id/b2" android:text="B2"
        android:layout alignParentLeft="true"
        android:layout_below="@+id/b1" />
    <Button ... android:id="@+id/b3" android:text="B3"
        android:layout centerHorizontal="true"
       android:layout below="@+id/b2" />
    <Button ... android:id="@+id/b4" android:text="B4"
        android:layout alignParentRight="true"
        android:layout below="@+id/b2" />
    <TextView ... android:id="@+id/tv1"
       android:text="I'm a TextView!"
        android:layout centerInParent="true" />
    <Button ... android:id="@+id/b5" android:text="B5"
        android:padding="50dp"
        android:layout centerHorizontal="true"
       android:layout alignParentBottom="true"
        android:layout marginBottom="50dp" />
</RelativeLayout>
```

FrameLayout

- meant to hold only a single widget inside, which occupies the entirety of the activity
 - most commonly used with layout fragments (seen later)
 - less useful for more complex layouts
 (can put in multiple items and move them to "front" in Z-order)

More layouts

- TableLayout
- FlowBoxLayout
- ConstraintLayout (new and default)
- And more...
